Total Marks

Name: _____ Date: ____ / ____ / ____

Answer ALL questions. Short-answer questions may be brief but must be precise. At least two extended answers require full sentences and developed explanation. The final 30-mark question must be a structured essay with a clear judgement.

- 1** Define the term 'class dealignment' in the context of UK voting behaviour, as used in studies of long-term voting trends.

(Total for Question 1 is 1 mark)

- 2** State two long-term demographic or structural factors commonly cited as influencing voting behaviour in the UK, naming the factor in each answer.

(Total for Question 2 is 2 marks)

- 3** Explain what is meant by 'valence voting' in UK elections and give one brief example of a valence issue.

(Total for Question 3 is 3 marks)

- 4** State two UK regions where the Conservative Party experienced relative decline in support across recent decades, naming the regions.

(Total for Question 4 is 2 marks)

- 5** Explain the concept of partisan dealignment in the UK and give one consequence for party organisations.

(Total for Question 5 is 4 marks)

- 6** Explain two ways in which age influences voting behaviour in the UK, and give a brief contemporary example for one way, including the election year cited.

(Total for Question 6 is 5 marks)

- 7** Explain three ways ethnicity can influence voting behaviour in the UK, giving at least one brief policy-related reason for the patterns described.

(Total for Question 7 is 6 marks)

- 8** Using the source below about regional voting patterns in the UK since 1997, analyse two ways the source supports the claim that region remains a significant long-term influence on voting behaviour, and two ways it suggests region's influence has weakened. Source: 'Regional summaries 1997 to 2019 show sustained Labour dominance in many urban northern seats and continued Conservative strength in rural southern constituencies, while Scotland shifted from Labour to SNP dominance after 2007; turnout and ticket-splitting vary between regions.'

(Total for Question 8 is 12 marks)

- 9** Explain two structural causes of the North-South divide in UK voting behaviour and give one implication of that divide for national party strategy.

(Total for Question 9 is 6 marks)

- 10** State two consequences of class dealignment for political parties' electoral strategies in the UK.

(Total for Question 10 is 4 marks)

- 11** Evaluate the view that class is no longer a significant influence on voting behaviour in the UK.

(Total for Question 11 is 30 marks)

Mark scheme · POL.UKP7 Long-Term Factors Influencing Voting Behaviour: Class, Age and Region

Question 1

- **B1** a concise correct definition, for example: the weakening of the link between social class and party support
- **Answer: Class dealignment is the weakening of the link between social class and party support, so class no longer predicts voting as strongly as in the past.**

Question 2

- **B1** one accurate factor named, e.g. age
- **B1** a second accurate factor named, e.g. social class, region, ethnicity, or gender
- **Answer: Any two of: age; social class; region (e.g. North-South differences, Scotland/England); ethnicity; gender.**

Question 3

- **B1** identifies valence voting as voting based on perceived competence on issues rather than ideology
- **B1** explains that voters choose the party they believe will manage issues best, not because of shared long-term identity
- **B1** gives one valid example, e.g. economic management, competence on the NHS, or handling of a crisis
- **Answer: Valence voting is when voters choose parties based on perceived competence or ability to manage key issues, rather than on ideological alignment. Example: many voters judge parties on who is best for economic management or who can best run the NHS.**

Question 4

- **B1** names one correct region, e.g. North of England
- **B1** names a second correct region, e.g. urban Scotland or some northern industrial towns
- **Answer: Any two of: the North of England (traditional industrial areas); urban Scotland; some older industrial Midlands towns.**

Question 5

- **B1** defines partisan dealignment as the decline in long-term party identification among voters
- **B1** explains that voters are less likely to identify with a single party over their life course
- **B1** gives one consequence, e.g. parties invest more in short-term campaigning and targeted messaging
- **B1** or gives an alternative consequence, e.g. parties rely more on professional campaign teams and less on mass membership
- **Answer: Partisan dealignment is the decline in stable party identification, meaning fewer voters see themselves as lifelong supporters of one party. One consequence is that party organisations invest more in short-term targeted campaigning and professional campaign staff rather than relying on large, active memberships.**

Question 6

- **B1** identifies one way age influences voting, e.g. older voters are more likely to support Conservative parties
- **B1** develops that younger voters tend to favour more progressive or left parties
- **B1** identifies a second mechanism, e.g. lifecycle or generational effects
- **B1** develops how lifecycle or cohort effects operate, e.g. attitudes shift with life stage or cohorts retain formative attitudes
- **B1** gives a brief contemporary example with year, e.g. 2019 general election where younger cohorts favoured Labour and older cohorts voted Conservative
- **Answer: Age influences voting because older voters are statistically more likely to support Conservative parties while younger voters tend to favour Labour or other progressive parties; this can reflect lifecycle effects (attitudes change as people age) or generational cohort effects (younger cohorts having distinct formative experiences). Example: in the 2019 general election younger age groups showed higher support for Labour compared with older age groups who leaned Conservative.**

Question 7

- **B1** identifies one way, e.g. many ethnic minority voters show higher support for Labour
- **B1** explains a reason related to policy, e.g. Labour perceived as more supportive on immigration policy, anti-discrimination and public services
- **B1** identifies a second way, e.g. religious identity intersecting with ethnic background can shape party preferences
- **B1** explains how socioeconomic status linked to ethnicity can influence voting, e.g. groups concentrated in urban, lower-income areas may favour parties promising stronger welfare provision
- **B1** identifies a third way, e.g. turnout differences among ethnic groups affecting electoral impact
- **B1** explains turnout influence, e.g. barriers to registration or trust in politics can reduce turnout and alter how ethnicity translates into seats
- **Answer: Ethnicity influences voting because many ethnic minority voters have tended to support Labour, partly because Labour is perceived as more supportive on immigration, anti-discrimination and public services; religious identity may intersect with ethnicity to shape party preferences in specific subgroups; socioeconomic patterns, with some ethnic groups concentrated in lower-income urban areas, can make them more likely to favour parties promising stronger welfare and public services. Turnout differences also matter, since lower turnout among some groups can reduce their electoral influence even if they have clear party preferences.**

Question 8

- **Level 0** (0): No relevant analysis of the source or regional voting patterns.
- **Level 1** (1-3): Basic paraphrase of the source with limited analysis. May identify one way in which region matters or has weakened, but lacks development.
- **Level 2** (4-6): Clear analysis using the source, with one developed point supporting region as significant and one developed point suggesting weakening, or two less developed points.
- **Level 3** (7-9): Detailed analysis using the source for both sides: at least two developed points showing how region remains significant and two developed counterpoints showing weakening, with reference to the source language.
- **Level 4** (10-12): Sophisticated, balanced analysis that integrates the source with wider knowledge, showing how the source both supports and qualifies the claim about region as a long-term influence, and reaching a reasoned conclusion about the overall weight of the source evidence.
- **Indicative content:**
 - Support 1: The source states Labour dominance in many urban northern seats from 1997 to 2019, which supports the idea that regional industrial and urban identities continue to shape long-term party strongholds.
 - Support 2: The source notes Conservative strength in rural southern constituencies, indicating enduring regional divides such as North-South differences in party preference tied to differing local economies and social composition.
 - Support 3: The shift in Scotland from Labour to SNP dominance after 2007 demonstrates region-specific political realignment that is consistent and long-term rather than a short-term fluctuation.
 - Weaken 1: The source mentions turnout and ticket-splitting variation between regions, which can dilute the predictive power of simple regional labels if voters in the same region vote across party lines or abstain at different rates.
 - Weaken 2: The phrasing 'sustained Labour dominance in many urban northern seats' allows for exceptions and local variation, implying region is not uniformly determinative across all seats in a region.
 - Weaken 3: The source covers 1997 to 2019; longer-term trends such as the Conservative gains in some northern seats in 2019 suggest regional patterns can change, reducing the fixed predictive power of region.
 - Integration: A strong answer links the source to wider knowledge, for example noting the 2019 Conservative gains in traditional Labour northern seats and the rise of the SNP after 2007 as evidence that region can both predict durable patterns and be the site of clear political realignments.
 - Conclusion: The source supports the claim that region remains significant, especially where identity and economic structure align, but it also shows qualification because turnout, ticket-splitting and political realignment mean region is a strong but not always decisive predictor of individual constituency outcomes.

Question 9

- **B1** identifies first structural cause, e.g. historical patterns of industrial employment and deindustrialisation in the North
- **B1** explains how that cause shapes voting, e.g. working-class concentration leading historically to Labour support, and post-industrial decline affecting party allegiance
- **B1** identifies second structural cause, e.g. economic inequality and concentration of high value services in the South East
- **B1** explains how that cause shapes voting, e.g. higher incomes and home ownership in the South linking to Conservative support
- **B1** gives one implication for party strategy, e.g. parties tailor policy offerings and campaign resource allocation regionally
- **B1** develops the implication, e.g. Conservatives focus on suburban southern voters while Labour targets public service promises to northern urban areas
- **Answer: Structural causes include the North's historical industrial base and later deindustrialisation, producing concentrations of working-class voters with long-term ties to Labour, and the South East's growth in high-value service industries and higher home ownership, which correlate with stronger Conservative support. An implication is that national parties tailor strategy regionally, allocating resources and policy promises to appeal to different regional electorates, for example Labour emphasising public services and regional investment in the North while Conservatives focus on home ownership and low taxation in the South.**

Question 10

- **B1** one valid consequence stated, e.g. increased emphasis on targeted swing voters
- **B1** development of that consequence, e.g. microtargeting and data-driven campaigning
- **B1** a second valid consequence, e.g. parties moderating policy positions to win floating voters
- **B1** development of that consequence, e.g. centrist repositioning to attract a broader electorate
- **Answer: Any two consequences: parties place more emphasis on winning targeted swing and floating voters, using data-driven microtargeting; parties moderate or reposition policy to appeal to a broader cross-class electorate, producing more centrist platforms.**

Question 11

- **Level 0** (0): No relevant content.
- **Level 1** (1-7): Basic assertions about class and voting with limited factual support, little analysis and no sustained evaluation. Arguments are generalised and unbalanced.
- **Level 2** (8-15): Clear knowledge and some analysis of evidence for and against the view. Evaluation is present but may be one sided or underdeveloped, and the judgement may be tentative.
- **Level 3** (16-23): Detailed, accurate knowledge and developed analysis engaging with both sides of the debate. Evaluation weighs different arguments and evidence and reaches a supported judgement, though some aspects may lack depth.
- **Level 4** (24-30): Sophisticated, wide-ranging knowledge and sustained analysis that integrates empirical evidence, theory and counter-arguments. Evaluation is balanced and reaches a clear, well-justified judgement on the extent to which class remains significant.
- **Indicative content:**
 - Arguments that class is less significant: evidence of class dealignment and partisan dealignment since the 1970s and 1980s, with a decline in class-based voting; more voters identifying as non-party identifiers; rise of valence voting where competence and economic management matter more than class identity.
 - Empirical support for decline: falling correlation between occupational class categories and vote share across successive general elections; growth of floating voters and volatility in many constituencies since the 1990s.
 - Arguments that class remains significant: class still correlates with voting in many areas, especially where socioeconomic inequalities persist; working-class concentration in specific regions often predicts party preferences, and class intersects with region, education and ethnicity to shape voting.
 - Empirical support for continued significance: examples where traditional class bases persist, such as Labour strength in many northern urban areas until 2019 and continued Conservative strength among older, more affluent voters; party realignments often operate along class-related economic issues such as austerity or welfare.
 - Complexity from interaction effects: class may operate indirectly via related variables such as education, occupation, and place of residence; education as a predictor has risen in importance and sometimes mediates class effects, for example higher education levels correlate with Remain voting in 2016 and with support for certain parties.
 - Counter-evidence and nuance: 2019 saw Conservative gains in some traditionally working-class seats, suggesting class voting is conditional on issues like Brexit and leadership; class retains predictive power but is not deterministic for all voters.
 - Theoretical points: distinction between lifecycle and cohort effects, and between structural class effects and short-term issue-based shifts; class may remain a structural background influence even when short-term valence or issue factors change outcomes.
 - Conclusion approaches: a balanced judgement might argue class is less dominant than in the mid 20th century but remains an important, though mediated, influence; its explanatory power has changed rather than disappeared, so the view that class is no longer significant is too strong, but recognising the decline is also accurate.
